

 **March 31, 2025**

It's Tariff Week

The Trump Administration is set to announce its retaliatory tariffs against America's trading partners on Wednesday, referred to as "Liberation Day" by President Trump.

Amid the uncertainty surrounding these impending tariffs, the market is struggling to price in their potential impact. The equity market needs clarity.

Earnings season officially begins on April 11th with the Banks reporting; investors will be focused on both first-quarter performance and CEO commentary on the prospects for their companies in the quarters ahead. Recent comments from CEOs whose companies have already reported earnings have had a more cautionary tone. The combination of tariffs and earnings season is likely to bring about continued volatility. But many of the equity market models we work with are signaling attractive levels for long-term investors.

Why President Trump Is Focused On Tariffs

A chart from Bank of America (BofA) clearly shows how heavily the U.S. is tariffed and taxed by other countries — and what the U.S. imposes in return. This week we face reciprocal tariffs on April 2 that go into effect on April 3, along with the 25% tariffs on non-U.S. manufactured autos.

BofA Says The U.S. Has The Lowest Trade Barriers Among Major Trading Nations

The Administration Imposed Auto Tariffs Last Week

The Trump Administration imposed a 25% tariff on automobiles and automotive parts not manufactured in the U.S. last week. Shares in Ford, General Motors and Stellantis declined, as did automakers in Europe, Japan, and South Korea. However, Hyundai pledged to invest \$21 billion in the U.S. in order to avoid any tariffs.

Tariffs On Canada, Mexico & Europe Are Not Negatively Impacting Their Stock Markets

The markets of the major trading partners of the U.S. are rallying with Canada and Europe near record all-time highs. The equity markets generally discount events 6 months ahead. These equity markets are indicating that investors believe that U.S. tariffs do not pose a long-term risk to corporate earnings in those countries. The positive spin is that the tariffs are not going to be as bad as investors fear. Stay-tuned!

Making And Building A Stock Market Bottom Takes Time And Patience

The S&P 500 has had a 10% correction, which normally happens once a year. Recovering from a correction takes time and could be a month or more. Historically, lows of a correction get tested and it's possible to make a new low in the testing process. Trump's tariffs could be the catalyst that begins the testing process. The S&P 500 has had a rally that has made the market overbought short-term. The good news is the weekly 14-week stochastic is finally oversold. The breadth of the market is also pointing to a rotation and not a bear market trend. Volume is also confirming this. So, because of the tariffs, we expect more volatility this week, but we will be looking for a test of the low.

Financials Not Showing A Recession

Financials, particularly the banks, are the heartbeat of the economy. When we look at the Financials, they are holding up well in the correction and performing well, relative to the overall market. This is another bullish indicator, suggesting the recent movement is just a market correction.

What If The Lows Don't Hold On A Test?

It is normal for markets to test their lows, and it is often the case that the low is undercut a bit. We've already had an intraday low at 5505 on the S&P 500, which is a correction of 10.50% off its high. That level might be undercut a bit on a test, and it can take months for the bottoming process to build. If the test of the low is accompanied by improving price momentum, it is a signal of a positive and bullish test. We still need more time for this!

But what if the test of the low does not hold? The next levels to test would result in a 15%-20% correction. This is not our base case. But if the market does decline this much, what happens once the market bottoms? It is likely the Federal Reserve (Fed) will cut interest rates several times over the next year, and the Fed is already easing up on quantitative tightening, selling less Treasuries on the balance sheet – and they are likely to stop all together. In essence, this is a form of cutting interest rates. Plus, we already have the 100 basis points cut last year. So, easing monetary conditions should stimulate risk assets. We maintain that the equity market remains in secular bull market, which indicates new highs are achievable.

Income, Spending & Inflation Data Not Bad

Last Friday, we received personal income and spending data along with Core Personal Consumption Expenditures (PCE). Income is still growing; spending is slowing, though it is still occurring; and inflation was mainly in line. The spending data was consistent with comments out recently from the CEO of Bank of America saying their data shows consumer spending for the first 2½ months was up 6%.

Yields Falling & Inflation Expectations In The Market Falling

Last week yields fell and the 10-year Treasury yield can continue to trend downward. The support level is 4.1%. A break of this level would point to 3.60%. Lower yields suggest inflation is not a problem at this time. Five-year Breakevens confirm this with yields in a range. Equity markets testing the lows and/or poor corporate outlooks announced during earnings calls could be the catalysts that drive yields lower. We continue to like owning yield within the market.

Artificial Intelligence Continues To Expand Into Daily Life

We've noticed that talk about artificial intelligence (AI) has died down a bit recently. But AI is becoming more integrated into daily life than ever before. We think AI is one of the most important technological advances in decades, perhaps in centuries.

Corporate Bond Market Shows No Signs Of Distress

The Federal Reserve Bank of New York (New York Fed) maintains an index to measure stress in the corporate bond market. Last week that index fell into the bottom 5% of all readings since its inception in 2005. We interpret this as an indication that there are no serious problems in the fixed income markets or the general economy at this time.

New York Fed Corporate Bond Market Distress Index (CMDI) Is Very Low Showing No Stress In The Economy

Doctor Copper Signals A Strengthening Economic Picture

Copper is often called “the commodity with a PhD in economics.” When the price of copper weakens, that typically indicates falling demand for copper, a metal that is required for all sorts of industrial and consumer products. And falling demand indicates a weakening economy. Conversely, rising copper prices usually mean the economy is strengthening. Copper prices just hit a record all-time high. We think this is yet another sign that the economy (including the global economies) is healthy. Moreover, nondefense capital goods orders were still growing year over year in February, indicating the economy is still expanding.

Stablecoins Getting A Lot Of Attention

According to CNBC, in February, Bank of America CEO Brian Moynihan said the Charlotte-based lender could introduce a stablecoin if regulation allows. JPMorgan has been exploring stablecoin development in the form of a digital token to settle transactions, while Goldman Sachs is working on its own tokenization strategy. Wells Fargo has been developing a U.S. dollar-linked stablecoin for internal settlement.

Stablecoins are especially attractive to banks because they can be used to make payments faster, cheaper and more transparent.

Another Week Of Intense Data... Plus Tariffs!

This week, we'll see a data deluge and perhaps a post-tariff tsunami of backlash.

We expect a volatile week. Wednesday is the day President Trump says his new tariffs will go into effect: that will be the big news for the week.

Labor market data for March will also be released, with Job Openings and Labor Turnover (JOLTS) on Tuesday, ADP payroll data on Wednesday, Challenger job layoffs on Thursday, and finally the highly anticipated nonfarm payroll and unemployment data on Friday. Everyone will be looking to see if the layoffs carried out by the Department of Government Efficiency (DOGE) are impacting the hard data yet.

We'll also see automotive sales for March, along with factory orders and international trade for February. The Fed will be watching this data for guidance on what to do about interest rates, and investors will be watching, too, to try to guess what the Fed will do.

There is more uncertainty in the markets than perhaps ever before; clearly more so than during the Great Financial Crisis of 2008–2009. These days economists and investment strategists simply do not know how to price in all the uncertainty.

Calendar

- Mon.** 9:45 am Chicago Business Barometer (PMI)
- Tue.** 9:00 am Richmond Fed President Thomas Barkin speaks
9:45 am S&P final U.S. manufacturing PMI
10:00 am Construction spending, ISM manufacturing, Job openings
